

ASIAN LADY BEETLE

Information & Preparation Sheet

Interior Treatments: People and pets MUST remain out of the treatment area for the duration of the treatment (1HR) and for 4-5 hours afterwards to allow the product time to dry properly.

PEST INFORMATION & TREATMENT GOALS

Some of the primary factors that draw Asian lady beetles to homes include:

Seeking Shelter & Warmth: Asian lady beetles are attracted to warm, sunlit surfaces, especially on the sides of buildings or on windows. As the weather turns cooler in late summer and fall, they may gather on the exterior of homes seeking warmth.

Light attraction: Like many other insects, Asian lady beetles are attracted to light. This can lead them to congregate around windows and doors.

Scent attraction: Asian lady beetles emit pheromones that can attract other beetles. Once a few beetles find their way into a home, their scent can draw in additional beetles, leading to larger aggregations.

We cannot prevent Asian Lady Beetles from showing up, but we can treat your property to minimize their presence, and to eliminate them quicker after they land on your house.

TREATMENT AREAS

There are no specific treatment areas because each situation is different. We will treat whichever areas of your property the Asian lady beetles are congregating, and the areas they are using to access the interior. Typically, this includes around the exterior windows and doors, as well as a mist treatment to the siding. Some situations may require an interior treatment around windows as well.

TREATMENT PREPARATION

The only preparation needed is to ensure we have access to the areas where you are seeing the Asian lady beetles. For example, if they are on the windows inside, ensure the windowsill is accessible.

TREATMENT WARRANTY

We include 1 follow-up with this treatment, to be completed within 60 days of the initial treatment (if necessary).

Seclira

Safety & Information Sheet

Trade Name	Registration Number	Active Ingredient	Dilution
Seclira WSG	34816	Dinotefuran	0.1 – 0.3%

Frequently Asked Questions

5. I have asthma; is it safe?

Once the pesticide is dry, there is no health risk for you to enter the space; however, prior to drying, the Seclira may irritate your asthma. If you have asthma, we recommend adding an additional hour to your wait time before re-entering the treated area.

6. Will it stain?

Dinotefuran will not stain surfaces or fabrics where water alone will not stain.

7. Is it safe for my pets and or my kids?

Seclira does not pose a threat to people or pets once it is dry, with the exception of bees, shrimp, and fish. However, Dinotefuran is highly toxic, and exposure to it while wet can lead to serious health problems in pets. To mitigate this, we dilute the pesticide significantly. Our mixture only contains 0.1% - 0.3% of the active ingredient, which minimizes the risk to pets and people. That said, it is still very important to remain out of the treatment zone until the pesticide has dried.

8. What if it isn't dry when I come home?

There are various reasons that may cause the pesticide to dry a little slower. For example, if it is a cold day or if you have hardwood floors. If the areas treated are still damp, leave for another hour and then return. If there is pooling, the liquid can be cleaned up with a towel and washed. This is common with hardwood floors because they do not absorb as much water, but this is not a concern because the pesticide will have been absorbed, and the liquid remaining will be 95-100% water.
