

PILL BUGS & MILLIPEDES

Information & Preparation Sheet

IF TREATING INTERIOR - People and pets MUST remain out of the treatment area for the duration of the treatment (1HR) and for 2-3 hours afterwards to allow the product time to dry properly.

PEST INFORMATION & TREATMENT GOALS

In our opinion, professional pest control is not needed for pill bugs or millipedes, as they do not bite or sting, and they aren't known to carry any harmful diseases. Once inside, they generally won't live long because they will be deprived of the moisture that they need to survive. While they are inside, they don't cause damage, nor do they reproduce indoors.

The main reason for professional pest control would be if you wish for the pill bugs and/or millipedes to die sooner, as our treatment cannot prevent them from showing up, it can only kill them faster once they do.

TREATMENT AREAS

The areas being treated will differ from one house to the next depending on each situation, but common areas to treat include around the perimeter of the house. If you are seeing them indoors, we will do a localized treatment to the areas you are seeing them, which is most commonly inside the garage and along baseboards in the basement (if applicable).

TREATMENT PREPARATION

- Provide a clear list of the areas you are seeing inside & outside.
- Interior Treatment Only: Remove all items from around the baseboard of the area being treated.
- Interior Treatment Only: Cover all fish tanks with a towel if there are any in the area being treated.

TREATMENT WARRANTY

We include 1 follow-up within the initial 30 days of treatment, to be completed if necessary and at your request.

DRAGNET

Safety & Information Sheet

Trade Name	Registration Number	Active Ingredient	Dilution
Dragnet FT	24175	Permethrin	0.05%

Frequently Asked Questions

1. I have asthma; is it safe?

Once the Dragnet is dry, there is no health risk for you to enter the space; however, prior to drying, the Dragnet may irritate your asthma. If you have asthma, we recommend adding an additional hour to your wait time before re-entering the treated area.

2. Will it stain?

The only material Dragnet is known to stain is silk. However, we dilute the Dragnet with water, so if your walls/floors are dirty, they may appear stained because the areas sprayed will be cleaner than the areas untreated. It is also important to keep in mind that Dragnet dries transparent, but until it is dry, it is noticeable.

3. Is it safe for my pets and or my kids?

When dry, Dragnet does not pose a threat to people or pets, with the exception of fish. This pesticide is highly toxic to aquatic creatures, and as such, we will not treat areas around fish tanks, streams, rivers, or ponds.

4. What if it isn't dry when I come home?

There are various reasons that may cause the pesticide to dry a little slower. For example, if it is a cold day or if you have hardwood floors. If the areas treated are still damp, leave for another hour and then return. If there is pooling, the liquid can be cleaned up with a towel and washed. This is common with hardwood floors because they do not absorb as much water, but this is not a concern because the pesticide will have been absorbed, and the liquid remaining will be 95-100% water.

If you have any questions or concerns, please feel free to contact us at 604-854-2847 or info@bugmanbc.com. If you'd like to review the Material & Safety Data Sheet, click [HERE](#)
